A QUICK GUIDE TO

LASER THERAPY FOR COLD SORES

WHAT IS LASER THERAPY?

- Laser therapy is a safe and effective treatment for cold sores
- It utilizes focused light energy to inactivate the virus responsible for cold sores

HOW DOES IT WORK?

- The laser targets the affected area, penetrating the skin without causing harm. By targeting the nerve endings and reducing inflammation, it can provide immediate relief from discomfort
- The light energy disrupts the virus, inhibiting its ability to cause further outbreaks

WHY CHOOSE LASER THERAPY?

- Safe: Laser therapy is a non-invasive and safe option for treating cold sores
- Quick: The procedure is quick (less than 5 min), providing immediate relief
- Effective: Many patients report a reduction in both the frequency and intensity of cold sore outbreaks after laser therapy

PUTTING COLD SORES IN HEALING MODE

- By inactivating the virus, laser therapy encourages the cold sore to enter the healing phase more rapidly. This can reduce the duration and severity of the outbreak
- By targeting the underlying virus responsible for cold sores, the laser not only helps suppress viral activity, but it can help prevent future flare-ups

PAIN-FREE SOLUTION

- One significant advantage of laser therapy is its painless nature
- Laser treatment is entirely painless and promptly alleviates discomfort while initiating the healing process right away
